Research Interests

My research interests lie in data-driven decision-making: using data to estimate the effects of actions (causal inference), choose the best action under constraints (optimization), and learn to act effectively over time under uncertainty (sequential decision-making, e.g., reinforcement learning). I am also interested in analyses that uncover actionable insights from data.

Education

Korea University (GPA 3.91/4.5, Major GPA 3.93/4.5) Seoul, Republic of Korea
B.B.A. in Business Administration *Mar 2019 – Aug 2025*

- Relevant Coursework: Business Analytics, Marketing Analytics, Data Management and Intelligent Management, Elementary Statistics, Business Mathematics

Experience

RealData Inc. Mar 2025 – Present
Data Analyst, Analytics Consulting Division

- Data analysis and modeling projects for public- and private-sector clients (see Projects).

Projects

Payout Rate Effect Analysis for Sports Betting Tickets (Proto) Sep 2025 – Jan 2026
RealData for Korea Sports Promotion Foundation (KSPO) *Python, SQL, Docker*

- Research project to support revenue-improvement policy decisions for Proto sports betting tickets, centered on the effect of the posted payout rate.
- Analyzed returns by betting combination and estimated the payout-rate effect with a model pipeline combining Prophet and linear regression.
- Built and deployed a simulator projecting sales and revenue changes by combination design, based on the estimated effects.

Marketing Consent Withdrawal Prediction Model Mar 2025 – Jun 2025
RealData for KB Securities *Python, SQL*

- Developed a model predicting customers likely to withdraw consent to marketing use of personal data, enabling proactive retention campaigns to preserve marketing reach.
- Trained LightGBM on data from over 1 million customers; formed hypotheses from feature importance and validated them through data analysis to derive prevention strategies.

Manufacturing Defect Detection Model Dec 2024 – Jan 2025
LIKELION Data Analytics Bootcamp Datathon *Python*

- Prototyped an AI-based defect detection model in response to the declining number of skilled workers in manufacturing.
- Applied a semi-supervised pipeline combining unsupervised methods (e.g., Autoencoder) with Logistic Regression to compensate for scarce labels, outperforming a supervised baseline.

Effect of Job Satisfaction on Turnover Intention among Gen Z Workers Dec 2023 – Feb 2024
Business Analytics Student Society BADA *Python*

- Investigated the drivers of turnover intention, motivated by the resource losses firms face from high Gen Z turnover.
- Estimated the effect of job satisfaction on turnover intention with linear regression on Human Capital Corporate Panel (HCCP) data, controlling for generation and age.

Other Experience

Summer Bootcamp, Graduate School of Data Science, Seoul National University Jul 2025

- Python Programming and Data Structures (Honors)
- Mathematics for Data Science
- Systems and C Programming (Honors)
- Probability and Statistics (Honors)

LIKELION Data Analytics Bootcamp Sep 2024 – Jan 2025

- Studied ML/DL methods and analytics tools including W&B and Tableau.
- Completed data visualization and AI model development projects.

Business Analytics Student Society BADA Sep 2023 – Jun 2024

President Jan 2024 – Jun 2024

Member Sep 2023 – Dec 2023

- Led theory and hands-on sessions on regression analysis, classification models, and NLP.

Technical Skills

Languages: Python, SQL, C

Tools & Libraries: scikit-learn, PyTorch, Docker, Tableau, W&B
